ROUND 2 / THE BUILD

SmartCampus AI

A smarter college for everyone: a student-first campus hub for finding study spaces, discovering course resources, reporting campus issues, and surfacing energy-saving opportunities.

Functional browser prototype · 25 October 2026

What the project does

SmartCampus AI brings everyday campus needs into one clear experience. Students can search available spaces, reserve a spot, browse and save learning resources, and send facilities reports. Campus administrators can triage reports, mark work resolved, and review energy trends and suggested opportunities.

Completed features

Space discovery Search and filter quiet, group, and power-equipped spaces; sort results; view availability; reserve a spot.	**Learning resources** Browse course-oriented guides and notes, filter and search, and save useful items.
Campus issue reporting Submit a category, location, and description; review report status in the issue list.	**Administrator tools** Review reports, resolve open issues, and see campus operations summaries.
Energy insights View illustrative energy trends, building comparisons, and a suggested after-hours check.	**Usable prototype** Responsive desktop and mobile interface. Browser storage preserves demo reports, saved resources, and reservations.

Technology and implementation

Built using HTML5, CSS3, and vanilla JavaScript, with no build step or external runtime dependencies. Sample records initialize the dashboard; browser local storage keeps user actions on the same browser. The app can be opened directly or hosted as a static website.

Data note: Campus name, seat counts, schedules, energy metrics, student sentiment, and AI opportunity are illustrative. This prototype does not connect to university systems, sensors, a server, or a live AI model.

Progress from Round 1 and plan changes

The build carries forward all four themes in the original SmartCampus AI concept: available study spaces, learning resources, campus issue reporting, and electricity-waste awareness for administrators. This version uses sample data and browser-only storage so judges can try the core interactions without campus credentials. Live integrations and shared accounts need institutional access and a backend.

Three substantial Round 3 improvements

1. Live space availability and reservations

Integrate class schedules and occupancy sensors, synchronize room status, and prevent double bookings.

2. AI-assisted facilities operations

Classify and route reports, identify duplicate submissions, and summarize recurring issues for facilities teams.

3. Connected energy analytics

Ingest meter data, detect after-hours anomalies against building baselines, and track verified savings after interventions.

Round 2 submission details

Working project link: Publish this project as a static site and insert its hosted URL.
Source repository link: Create a repository and insert its URL.
Source files: index.html, styles.css, app.js. The accompanying README has run instructions and feature details.
